1. PRODUCT DESCRIPTION

The VICB 8002 is a 6U (double height) VME board constructed to the VME64x standard, with EMC front panel, injector/ejector handles, guide pin and slot keying, static discharge protection, hot swap capability, blue power up LED, geographical addressing or jumpers, 5-row P1 and P2 connectors and 5-row P0 connector.

The module features hot-swap capability with auto power up and host interaction. An on-board FPGA allows full mapping of the I-P board memory, I/O and ID space.

The VME interface supports short I/O access A16:D32:D16:D8(EO), standard I/O access A24:D32:D16:D8(EO) and extended memory access A32:D32:D16:D8(EO).

Four Industry Pack sites are available and can accept 4 single-size Industry packs.

The carrier board supports the 8MHz and 32MHz IP interfaces.

The VMEbus interrupt levels IRQ1 to IRQ7 can be selected and enabled by writing to an on board register.

The interrupt release mechanism can be either release-on-acknowledge (ROAK) or release-on-register-access (RORA).

The base address of extended memory can be set by register or by geographical addressing lines. The size of the IP memory can be set at 1MB, 2MB, 4MB or 8MB per site.

The interrupts int 0 and int 1 of all Industry Pack can be enabled on an individual basis.

Four front panel mounted LEDs flash to visually confirm completed IP access cycles to individual slots.

There is a TTL input on the front panel which allows connection to any or all of the IP card Strobe lines.

The carrier board has some thickened I/O tracks to allow the IP boards to be powered externally to give full isolation.

All I/O is via the VME backplane P0 and P2 connectors as specified in the VME64 extensions specification. The signals connect to the industry pack sites according to the VME64x Greenspring pinout for IP module carriers.

Hytec has a number of rear-mounted transition card with high-density 50-way [SCSI2] connectors which can accept all I/O signals and provide any necessary signal conditioning.

1.1 Key Features

- VME64 extensions / Industry Pack Carrier Board
- VME64x rear panel I/O
- Full EMC shielding and insertion/extraction handles
- Fully Hot-Swap capable with auto power-up and host interaction
- 6U (double height) VME base card
- User selectable VME interrupt level
- Geographical addressing
- Front panel TTL input to IP cards via Strobe lines
- Thickened I/O lines to allow externally power supply to IPs
- VME 64x Configuration ROM
- On-board clock generation
- VME64x guide pin and slot keying
- 3.3V supply to P2 connector (Issue 3 PCB)
- 5V supply to P2 connector (Issue 3 PCB)
- 8MHz or 32MHz IP interface
- Interrupt release settable ROAK or RORA.
- Interrupt can be generated during hotswap removal when extractor handles opened

2. USE OF THE VME DATA BUS AND MEMORY ACCESS

2.1 VME Addressing

The module uses A16/D32/D16/D8 (EO) (Even and Odd byte) or A24/D32/D16/D8 (EO) for accesses to the IP I/O, IP ID and Carrier board Configuration Registers.

The base address of the carrier board configuration registers is determined either by PCB jumper settings (J6 to J10) or by geographical addressing lines GA0 to GA4.

The PCB jumpers are used only where geographical addressing is not available and will not override the GA lines.

Address	Offset	Range	Assignment	Size
I/O Base+	0x0000	0x0000 0x007F	IP A I/O Space	128 Bytes
I/O Base+	0x0080	0x0080 0x00FF	IP A ID Space	128 Bytes
I/O Base+	0x0100	0x0100 0x017F	IP B I/O Space	128 Bytes
I/O Base+	0x0180	0x0180 0x01FF	IP B ID Space	128 Bytes
I/O Base+	0x0200	0x0200 0x027F	IP C I/O Space	128 Bytes
I/O Base+	0x0280	0x0280 0x02FF	IP C ID Space	128 Bytes
I/O Base+	0x0300	0x0300 0x037F	IP D I/O Space	128 Bytes
I/O Base+	0x0380	0x0380 0x03FF	IP D ID Space	128 Bytes
I/O Base+	0x0400	0x0400 0x047F	Carrier on board registers	128 Bytes
I/O Base+	0x0480	0x0480 0x04FF	Green Springs Type I ID	128 Bytes
I/O Base+	0x0600	0x0600 0x07FF	VME64x configuration ROM (See appendix B)	512 Bytes

8002 A16 and A24 address Map

2.1.1 Short Addressing (A16 AM29h and 2Dh)

In Short address mode the geographical addressing lines equate to the address lines GA0=A11 to GA4=A15 and the jumper address setting J6=A11 to J10=A15.

A11 - A15 is the module address determined by the setting of the relevant PCB jumpers or geographical address lines

Address modifiers

IP I/O, IP ID and Carrier board Configuration Registers:

AM29 Short (A16) non-privilege

AM2D Short (A16) supervisory

2.1.2 Standard Addressing (A24 AM39h and 3Dh)

The A24 base address is determined either by PCB jumper settings J6=A19 to J10=A23 or by geographical addressing lines GA0 =A19 to GA4=A23.

IP I/O, IP ID and Carrier board Configuration Registers:

AM39 Standard (A24) non-privilege

AM3D Standard (A24) supervisory

2.1.3 Carrier board Configuration ROM (A24 AM2Fh)

See **appendix B** for the contents of the configuration ROM.

Address modifiers

AM2F Configuration ROM/Control & Status Registers.

2.2 Memory Access

The module uses A32/D16/D8 (EO) (Even and Odd byte) for accesses to the IP memory.

The base address of the memory can be set by either the Geographical address lines/jumpers or by using the Memory Offset Register. Writing a 1 to bit 6 of the CSR CB (base+8h) selects the Memory Offset Register to set the base address

Using the Memory Offset Register to store the base address allows the address lines A22 to A31 to be used to set the base address.

Geographical addressing uses the lines GA0=A22 to GA4=A26.

First need to select whether Geographical address lines or the Memory Offset register are to define the extended memory start address. This is selected using MEM MODE (bit 6) of the CSR CB register.

MEM MODE (bit 6 CSR)	Memory Addressing Mode
0	Geographical address lines
1	Memory Offset register

Bit 6 CSR CB setting the memory address mode

2.2.1 IP Memory Size

Some controllers have a limited memory range so to take account of this when using geographical and register addressing the memory size allocated to each IP card can be controlled:-

CSR CB		IP Memory Size	Address Lines	
IPMS1 (bit 8)	IPMS0 (bit 7)		Geographical Addressing	Memory Offset Reg
0	0	1MB	A22-A26	A22-A31
0	1	2MB	A23-A26	A23-A31
1	0	4MB	N/A	A24-A31
1	1	8MB	A27-A31	A25-A31

Here the GA address is shifted up one. This only allows 16 slots to be used with geographical Addressing

2.2.2 Carrier Board Memory Map

Address	Memory Range				Memory Assignment
	1MB	2MB	4MB	8MB	
Memory Base +	0x000000 0x0FFFFFFF	0x000000 0x1FFFFFFF	0x000000 0x3FFFFFFF	0x000000 0x7FFFFFFF	IP A
Memory Base +	0x100000 0x1FFFFFFF	0x200000 0x3FFFFFFF	0x400000 0x7FFFFFFF	0x800000 0xFFFFFFFF	IP B
Memory Base +	0x200000 0x2FFFFFFF	0x400000 0x5FFFFFFF	0x800000 0xBFFFFFFF	0x1000000 0x17FFFFFFF	IP C
Memory Base +	0x300000 0x3FFFFFFF	0x600000 0x6FFFFFFF	0xC00000 0xFFFFFFFF	0x1800000 0x1FFFFFFF	IP D

Address Modifiers

Memory: AM09 or AM0D (extended non-priv. or supervisory)

3. ON BOARD FEATURES

The configuration and control of the 8002 module is via registers:

Base	Offset	Register	Description
Base +	0x400	IP Status	Allows state of IP ints and error flags to be monitored
Base +	0x404	Memory Offset	Sets base address of memory
Base +	0x408	Control & Status Register CB	Set up of VME part of 8002
Base +	0x40C	IP Interrupt Select	Selects IP interrupts to be used
Base +	0x410	Hot Swap removal IRQ Vector	Selects IP interrupts to be used

8002 On-Board Registers

3.1 IP Status Register (Read Only)

Address: Read = Base + 00

D15	D14	D13	D12	D11	D10	D09	D08	D07	D06	D05	D04	D03	D02	D01	D00
				ERR D	ERR C	ERR B	ERR A	INT REQ D1	INT REQ C1	INT REQ B1	INT REQ A1	INT REQ D0	INT REQ C0	INT REQ B0	INT REQ A0

3.2 Memory Offset (Read/Write)

Address: Read = Base + 04, Write = Base + 04

D15	D14	D13	D12	D11	D10	D09	D08	D07	D06	D05	D04	D03	D02	D01	D00
A31	A30	A29	A28	A27	A26	A25	A24	A23	A22	x	x	x	x	x	x

X= don't care

3.3 Control & Status Register Carrier Board (CSR CB)

Control (Write)

Address: Base + 08

D15	D14	D13	D12	D11	D10	D09	D08	D07	D06	D05	D04	D03	D02	D01	D00
NU	NU	SWINT 2	SWINT 1	SWINT 0	POFF INT	INT RELS	IPMS 1	IPMS 0	MEM MODE	IPCLK SEL	INTSEL 2	INTSEL 1	INTSEL 0	INTEN	Rst

Status (Read)

Address: Base + 08

D15	D14	D13	D12	D11	D10	D09	D08	D07	D06	D05	D04	D03	D02	D01	D00
NU	NU	0	0	0	0	INT RELS	IPMS 1	IPMS 0	BADD SEL	IPCLK SEL	INTSEL 2	INTSEL 1	INTSEL 0	INTEN	Rst

- Rst** Clears status register to zero when written as a '1'.
- INTEN** Enable interrupt from carrier board to VMEbus backplane (Cleared if INT RELS = '1').
- INTSELO** Select VME interrupt level.
- INTSEL1** Select VME interrupt level. (See section 4).
- INTSEL2** Select VME interrupt level.
- IPCLKSEL** Select 8MHz IP clock =0 or 32MHz clock =1.
- BADDSEL** Select memory base address to be defined by geographical address lines=0 or by Memory offset vector register=1.
- IP MS0** Set IP memory size.
- IP MS1** Set IP memory size. (See section 2.2)
- INT RELS** Interrupt release RORA=0 and ROAK = 1 (see section 4)
- POFF INT** When set to '1' an interrupt is generated during hot swap removal of unit when extractor handles opened (see section 5).
- SWSEL0** Select VME interrupt level during hot swap removal (see section 5).
- SWSEL1** Select VME interrupt level during hot swap removal (see section 5).
- SWSEL2** Select VME interrupt level during hot swap removal (see section 5).

3.4 IP Interrupt Select Register (Read/Write)

Address: Base + 0C

D15	D14	D13	D12	D11	D10	D09	D08	D07	D06	D05	D04	D03	D02	D01	D00
NU	NU	NU	NU	NU	NU	NU	NU	IPINT D1	IPINT C1	IPINT B1	IPINT A1	IPINT D0	IPINT C0	IPINT B0	IPINT A0

This selects which IP interrupt lines will be enabled.

'1' = corresponding IP card interrupt enabled.

3.5 Hot Swap Removal IRQ Vector Register (Read/Write)

Address: Base + 10

D15	D14	D13	D12	D11	D10	D09	D08	D07	D06	D05	D04	D03	D02	D01	D00
V15	V14	V13	V12	V11	V10	V09	V08	V07	V06	V05	V04	V03	V02	V01	V00

3.6 VME System and Board Resets

3.6.1 A VME system reset will clear the following registers:

- CSR CB
- Memory Offset Register
- IP Interrupt Select register

3.6.2 A board reset generated from the CSR CB bit 0 will clear the following registers:

- CSR CB
- IP Interrupt Select register

4. INTERRUPT SETTINGS

The interrupt level generated by the carrier board is set using the CSR CB register INTSEL0 (bit 2), INTSEL1 (bit 3) INTSEL2 (bit 4).

Interrupt Level	INTSEL 2	INTSEL 1	INTSEL 0
None	0	0	0
IRQ 1	0	0	1
IRQ 2	0	1	0
IRQ 3	0	1	1
IRQ 4	1	0	0
IRQ 5	1	0	1
IRQ 6	1	1	0
IRQ 7	1	1	1

Interrupt Level Select

The IP Interrupt Select register allows the user to enable only the IP interrupts required and mask of the rest. To select an IP interrupt write a '1' to the appropriate bit of the register see **section 3.4** above. The interrupt vector is held on the individual IP cards.

To enable VME interrupts from the carrier board to the VMEbus backplane set bit 1 of the CSR CB to '1'. Writing a '0' to this register disables the interrupts.

The VME interrupt is released by clearing the interrupt enable bit INTEN (bit 1) in the CSR on acknowledge if bit 9 set to '1' in CSR. If bit 9 set to '0' in the CSR the interrupt is released when the interrupt service routine clears the interrupt enable bit in the CSR (bit 1 INTEN).

The IP interrupts are prioritised in the 8002 where IP A has the highest and IP D the lowest.

Each IP card can be loaded with a separate IP vector, then when an interrupt occurs the controller will be given the interrupt vector of the IP card which caused the interrupt.

If all four card interrupt at the same time then IP A will be serviced first then IP B then IP C and finally IP D.

Reading the IP Status register of the 8002 at base + 00 (READ ONLY) shows which IP cards have interrupts pending.

5. INTERRUPT GENERATED DURING HOT SWAP REMOVAL

An interrupt is generated during hot swap removal of unit when extractor handles opened.

The interrupt level generated by the carrier board during hot swap removal of unit is set using the CSR CB register SWINT 0 (bit 11), SWINT 1 (bit 12) SWINT 2 (bit 13).

Interrupt Level	SWINT 2	SWINT 1	SWINT 0
None	0	0	0
IRQ 1	0	0	1
IRQ 2	0	1	0
IRQ 3	0	1	1
IRQ 4	1	0	0
IRQ 5	1	0	1
IRQ 6	1	1	0
IRQ 7	1	1	1

Interrupt Level Select

To enable VME interrupts from the carrier board to the VMEbus backplane during hot swap removal set bit 10 of the CSR CB to '1'. Writing a '0' to this register disables the interrupt during hot swap removal. The VME interrupt during hot swap removal is released on acknowledge.

6. VME64X KEYING AND ALIGNMENT PIN

The keying mechanism provides for three key holes on top and three keying holes on the bottom of each board and subrack slot. Each key hole can be keyed with a "No Key" or a keying peg in one of four positions. With three key holes top and bottom the scheme provides a total of 15,625 keying combinations.

7. Power up Problem On Some Backplanes

If the unit does not power up i.e. Blue Led 'ON' it maybe due to some VME backplanes grounding the LI/I* signal. This grounding should be removed for correct operation. If the grounding cannot be removed on the backplane please contact Hytec for a work around solution.

APPENDIX A PCB JUMPERS

Hytec IP Board

J2 Must be IN Factory set.

J4 Supplies 5V to pins P2A 32 and P2C 32 (Delivered Not selected).

J6 – J10 Base address use only when geographical address not present. Make according to required A15-A11 base address

J12 Must be IN Factory set.

**APPENDIX B Carrier Board Configuration ROM**

Address Offset	Value	Definition
0x03	C1	Check Sum
0x07	00	Length of ID ROM MSB
0x0B	02	Length of ID ROM
0x0F	00	Length of ID ROM LSB
Configuration ROM data access width		
0x13	0x83	
CSR data access width		
0x17	0x83	
CSR space Specification ID		
0x1B	0x02	VME64x-1997
Identify a Valid CR		
0x1F	0x43	'C'
0x23	0x52	'R'
Manufacturer's ID		
0x27	0x00	
0x2B	0x80	
0x2F	0x03	
Board ID		
0x33	0x80	
0x37	0x02	
0x3B	0x00	
0x3F	0x00	
Revision ID		
0x43	0x03	PCB issue
0x47	0x03	Xilinx version (same as PCB issue)
0x4B	0x00	Xilinx revision nos
0x4F	0x07	Xilinx revision nos
ASCII string null terminated or 0x000000		
0x53	0x00	
0x57	0x00	
0x5B	0x00	
Reserved for future use		
0x5F to 0x7B		
Program ID code		
0x7F	0x01	No program, ID ROM only
Start of user defined area		
0x80		
Board Serial Number		
0xCB, 0xCF, 0xD3	0x	BEG_SN MSB
0xD7, 0xDB, 0xDF	0x	END_SN LSB
AM code mask		
0x123 .. 0x13F	0x2200220000002200	AM codes 3D,39,2D,29 ,D,9

Reading the Configuration ROM using A16 (AM29h and AM2Dh) and A24 (AM39h and AM3Dh) the address is VME address 600h + Configuration ROM offset.

APPENDIX C ID PROM Registers (GreenSpring Format)

Address Offset	Value	Definition
0x481	0x49	ASCII "I"
0x483	0x50	ASCII "P"
0x485	0x41	ASCII "A"
0x487	0x43	ASCII "H"
0x489	0x80	Manufacturer's ID
0x48B	0x82	Model Number
0x48D	0x0X	Revision
0x48F	0x00	Reserved
0x491	0x00	Driver ID, low byte
0x493	0x00	Driver ID, high byte
0x495	0x0C	No of bytes used
0x487		CRC

The low four bytes contain the ASCII text "IPAH" this signifies that the 8002 carrier board supports the 8MHz and 32MHz IP interfaces.

NOTE

In previous version of the 8002 firmware the ASCII text was "IPAC" denoting that the carrier board supported only 8MHz IP interfaces.

PRODUCT SPECIFICATIONS

Power Requirements

+5V @ 600mA typical

+12V @ 30mA

-12V @ 30mA

+3.3V @ approx 10mA

Additional power maybe consumed by Industry Packs.

Operating Temperature Range

0 to +45 deg Celsius ambient.

Mechanical

6U single width VME module with access to 5 row P0, P1 and P2 connectors.

IP Memory Mapping

VME Access A32:D16:D8(EO) AM Codes: 09h and 0Dh.

IP I/O Mapping

VME Access A16:D16:D8(EO) AM Codes: 29h and 2Dh.

VME Access A24:D16:D8(EO) AM Codes: 39h and 3Dh.

Front Panel Indicators and Inputs

'VME'	LED (green)	illuminates for a minimum of 100msecs whenever the module is accessed via the VME bus.
'Not Configured'	LED (blue)	indicates the state of the VME module during hot swap operation.
IP ACK	LED's (red)	indicate when an IP card has sent an ACK .

Front Panel Inputs

Inhibit Single TTL. This input has a 10K pull-up resistor to 5Volt supply.
Connector type: 0302

P2 pin assignment

Notes:

The signal name is made up of a letters and a number. The letters in front of the number identifies the IP Module Slot and the number identifies the I/O pin number of that module.

Example: SIG=IOB15 ROWD=P2.D13 (shown in bold)

IO = IP module I/O line

B = IP module 'C'

15 = I/O pin number '15'

This pin on the IP module connects to P2, Pin 13 Row D.

Signals shaded in gray Denotes pins with thickened tracks which can be used for power inputs

Note:

Out+5V is provided by the 8002 board and can be put on to the pins by setting jumper J4.
